Safety Information

We use note, caution and warning symbols throughout this book to draw your attention to important operational and safety information.

A “NOTE” marks a short message to alert you to an important detail.

A “CAUTION” safety alert appears with information that is important for protecting your equipment and performance. Be especially careful to read and follow all cautions that apply to your application.

A “WARNING” safety alert appears with information that is important for protecting you, others and equipment from damage. Pay very close attention to all warnings that apply to your application.

The safety alert symbol, !, (an exclamation point in a triangle) precedes a general CAUTION or WARNING statement.

The electrical hazard symbol, ⚡, (a lightning bolt in a triangle) precedes an electric shock hazard CAUTION or WARNING safety statement.

Technical Assistance

If you encounter a problem with your Watlow controller, see the Troubleshooting Table in the Appendix and review all of your configuration information to verify that your selections are consistent with your application: inputs; outputs; alarms; limits; etc. If the problem persists after checking the above, you can get technical assistance from your local Watlow representative, or by dialing (507) 454-5300.

An applications engineer will discuss your application with you.

Please have the following information available when calling:

- Complete model number
- All configuration information
- User’s Manual
- Diagnostic Menu readings

Your Feedback

Your comments or suggestions on this manual are welcome. Please send them to: Technical Writer, Watlow Winona, 1241 Bundy Blvd., P.O. Box 5580, Winona, MN 55987-5580; phone: (507) 454-5300; fax: (507) 452-4507. The Series 96 User’s Manual is copyrighted by Watlow Winona, Inc., © February 2002, with all rights reserved. (2198)

Chapter One
Overview

Introduction

With one universal input, a second auxiliary input and four outputs, the Series 96 can be programmed to perform temperature measurement, input event switching, remote set point input, heating, boost heating, cooling, alarms, digital communications, ramp and soak, and retransmit. These features make this controller ideally suited for applications involving plastics, packaging, semiconductor, food processing and lab equipment.

Set point ramping operations include two files with eight steps in each file. The files may be linked to create a single 16-step profile for varying ramp and soak needs.

With fast 10hz sampling, burst firing outputs, NEMA 4x front panel, and 0.1 percent accuracy, the Series 96 can easily handle some of the toughest application needs. The Series 96 is manufactured by ISO 9001-registered Watlow Winona with reliability backed by a three-year warranty.

![Series 96 inputs and outputs diagram]

**Figure 1.1** – Series 96 inputs and outputs.
Chapter Two
Installation

Figure 2.1 – Series 96 multiple panel cutout dimensions.

NOTE: Measurements between panel cutouts are the minimum recommended.

For rapid mounting, use Greenlee 1/16 DIN punch, die, draw stud, part number 60287, available from Grainger.

Installing the Series 96 Controller

Installing and mounting requires access to the back of the panel.

1. Make the panel cutout using the mounting template dimensions found in this chapter.

2. Check to see that the gasket is properly seated into the gasket channel on the front bezel and that it is not twisted. Make sure that the rounded surface of the gasket is the surface that is exposed from the gasket channel, as this is the surface that will mate to the panel surface. Insert the controller into the panel cutout.

3. With the controller inserted into the panel cutout, take the retention collar and slide it over the controller, making certain that the two locating holes in the retention collar are visible from the rear of the controller, with one hole pointing up and one pointing down. Then, take the mounting collar and slide it over the controller, making certain that one cantilever is pointing up and one is pointing down also. With one hand holding the controller and the other hand using a #2 Phillips screwdriver, tighten the two screws in the mounting collar until the gap between the bezel and panel surface is .025" maximum.
See the figure below. Make sure that you cannot move the controller back and forth in the cutout. If you can, you do not have a proper seal.

Figure 2.2a – Installing the controller.

Figure 2.2b – Series 96 gap dimensions.

⚠️ CAUTION: Follow the installation procedure exactly to guarantee a proper NEMA 4X seal. Make sure the gasket between the panel and the rim of the case is not twisted and is seated properly. Failure to do so could result in damage to equipment.

NOTE: Be careful not to over-tighten the screws. This may cause the mounting cover to fail. Over-tightening occurs when the front bezel is touching the customer’s front panel.

Removing the Series 96 Controller

1. Hold the controller with one hand while using the other hand to loosen the screws with a #2 Phillips screwdriver until the end of the screw is flush or past the end of the cantilevers; see the figure below.

2. After the screws have been loosened, hold the controller with one hand while squeezing the two screws together with the other hand. Then simply slide the mounting collar off the controller.

Figure 2.2c Removing the controller.
Chapter Three

Wiring

NOTE:
It is advisable to check Output 1-4 hardware. These outputs may differ from those listed for the model number on the controller and described in this manual, indicating a customized hardware setup.

CAUTION:
If high voltage is applied to a low-voltage unit, irreversible damage will occur.

WARNING:
To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series 96. Failure to do so could result in injury or death.

CAUTION:
Maintain isolation between input 1 and input 2 to prevent a ground loop. A ground loop may cause incorrect readings, dashes across the upper display or the display of error codes. Failure to follow this guideline could result in damage to equipment and product.

Input-to-Output Isolation

Figure 3.1a Isolation blocks.

Power Wiring

100 to 240V~ (ac), nominal (85 to 264 actual) 96 A
24 to 28V≈ (ac/dc), nominal (21 to 30 actual) 96 B

NOTE:
It is advisable to check Output 1-4 hardware. These outputs may differ from those listed for the model number on the controller and described in this manual, indicating a customized hardware setup.

CAUTION:
If high voltage is applied to a low-voltage unit, irreversible damage will occur.

WARNING:
To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series 96. Failure to do so could result in injury or death.

CAUTION:
Maintain isolation between input 1 and input 2 to prevent a ground loop. A ground loop may cause incorrect readings, dashes across the upper display or the display of error codes. Failure to follow this guideline could result in damage to equipment and product.

Sensor Installation Guidelines

Thermocouple inputs: Extension wire for thermocouples must be of the same alloy as the thermocouple to limit errors.

When using a process signal (4-20mA, 0-5V≈ [dc], etc.) for the remote set point or a voltage input for the digital input 2, use an ungrounded or isolated thermocouple. If a grounded thermocouple is required, the signal to input 2 must be isolated to prevent possible ground loops.

RTD input: Each 1Ω of lead wire resistance can cause a +2°F error when using a two-wire RTD. A three-wire RTD sensor overcomes this problem. All three wires must have the same electrical resistance (i.e., same gauge, same length, multi-stranded or solid, same metal).

Process input: Isolation must be maintained between input 1 and input 2. If both input 1 and input 2 are process signals, a separate power supply and transmitter must be used for each input. These inputs must be electrically isolated from one another to prevent ground loops.
NOTE:
Successful installation requires five steps:

- Choose the controller’s hardware configuration and model number (Appendix);
- Choose a sensor (Chapters Three and Six, and Appendix);
- Install the controller (Chapter Two);
- Wire the controller (Chapter Three) and
- Configure the controller (Chapters Four, Five and Six).

WARNING:
To avoid potential electric shock and damage to property and equipment, use National Electric Code (NEC) safety practices when wiring and connecting this unit to a power source and to electrical sensors or peripheral devices. Failure to do so could result in injury or death.

CAUTION:
Maintain isolation between input 1 and input 2 to prevent a ground loop. A ground loop may cause incorrect readings, dashes across the upper display or the display of error codes. Failure to follow this guideline could result in damage to equipment and product.

**CAUTION:**
Process input does not have sensor break protection. Outputs can remain full on.

NOTE:
Switching inductive loads (relay coils, solenoids, etc.) with the mechanical relay, switched dc or solid-state relay output options requires use of an R.C. suppressor.
Watlow carries the R.C. suppressor Quencharc brand name, which is a trademark of ITW Paktron. Watlow Part No. 0804-0147-0000.

WARNING:
To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series 96. Failure to do so could result in injury or death.

NOTE:
Switching inductive loads (relay coils, solenoids, etc.) with the mechanical relay, switched dc or solid-state relay output options requires use of an R.C. suppressor.
Watlow carries the R.C. suppressor Quencharc brand name, which is a trademark of ITW Paktron. Watlow Part No. 0804-0147-0000.

WARNING:
To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series 96. Failure to do so could result in injury or death.
WARNING:
To avoid damage to property and equipment, and/or injury of loss of life, use National Electric Code (NEC) standard wiring practices to install and operate the Series 96. Failure to do so could result in injury or death.

NOTE:
The CMC converter requires an external power supply when used with a laptop computer.

If the system does not work properly, it may need termination resistors at each end of the network. A typical installation would require a 120-ohm resistor across the transmit/receive terminals (19 and 21) of the last controller in the network and the converter box or serial card. Pull-up and pull-down resistors may be needed to maintain the correct voltage during the idle state.

WARNING:
To avoid potential electric shock and damage to property and equipment, use National Electric Code (NEC) safety practices when wiring and connecting this unit to a power source and to electrical sensors or peripheral devices. Failure to do so could result in injury or death.

WARNING:
Install high- or low-temperature-limit control protection in systems where an over-temperature fault condition could present a fire hazard or other hazard. Failure to install temperature-limit control protection where a potential hazard exists could result in damage to equipment and property.

Figure 3.9 – System wiring example.
Chapter Four
Navigation and Software

Keys and Displays

This chapter explains keys, displays and navigation skills, and presents charts showing how to accomplish basic tasks, including setting up the Custom Menu, which is unique to the Series 96. You’ll also find a complete software map.

**Figure 4.1 – Series 96 keys and displays.**
Navigating the Series 96

Choose a page (Operation, Setup or Factory) and press its key sequence. The page appears in the lower display.

- **Operation Page:** Press ⊕ and ⊖ keys together for 3 seconds.

- **Setup Page:** Press ⊕ and ⊖ keys together for 6 seconds.

- **Factory Page:** Press ⊕ and ⊖ keys together for 6 seconds.

- **Home Page:** From anywhere, press the ⊖ key.

Press ⊕ or ⊖ to find a specific menu in a page. The menu appears in the upper display and the page remains in the lower display.

Press ⊕ to enter the list of parameters in the menu displayed. The menu's parameters appear in the lower display and the values in the upper. To go backward through the parameter list press ⊕ and ⊖ together.

Press ⊕ or ⊖ to select a value, either alpha or numeric.

Press ⊕ to set the value and go to the next parameter.
**Program Menu**

(see pg. 7.1)

**Operations Page**

- **Monitor Menu**
  - Operations Page
- **Operations Page**

*Added if ramping version of controller is selected (96__-____-AA__).

**Removed if ramping version of controller is selected (96__-____-AA__).
Basic navigation for new users

Use this example task to learn how to use the keys and displays. For more information about the control features available in the Series 96, see Chapter Five. For a table of all parameters and values, see Chapter Six.

Configure the controller

To configure the controller to suit your application, go to the Setup Page, enter the menus and set the parameters for the system, its inputs and outputs.

<table>
<thead>
<tr>
<th>Do this</th>
<th>Press these keys</th>
<th>You’ll see*</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Go to the Setup Page from the Home Page.</td>
<td>⬆Up-arrow and ⬇Down-arrow keys for 6 seconds.</td>
<td>After 3 seconds the Operations Page appears in the lower display; after 6 seconds the Setup Page appears in the lower display. A menu is in the lower display.</td>
</tr>
<tr>
<td>2 Choose a menu to enter.</td>
<td>⬆Up-arrow key.</td>
<td>The Setup Page remains in the lower display while menu names appear in the upper display.</td>
</tr>
<tr>
<td>3 Go to a parameter.</td>
<td>⬆Advance key.</td>
<td>The menu’s parameters appear in the lower display and the values appear in the upper display. (Note: When you enter a menu, the display changes. Instead of the Setup Page and menu, you see parameter and value.)</td>
</tr>
<tr>
<td>4 Choose a value.</td>
<td>⬆Up-arrow key, until you reach the desired value.</td>
<td>Values appear in the upper display when the parameter is in the lower display.</td>
</tr>
<tr>
<td>5 Set a value and go on to the next parameter.</td>
<td>⬆Advance key (when the chosen value is displayed).</td>
<td>You will see the chosen value in the upper display. After pressing the Advance key, the next parameter appears in the lower display, with one of its values in the upper display. Values auto-enter after 5 seconds.</td>
</tr>
</tbody>
</table>

Summary

To make a selection or choice: Press ⬆Up-arrow key or ⬇Down-arrow key.

To move or change location in a page or menu: Press ⬆Advance key or ⬆Home/Infinity key.

*What you see depends on the options included in your controller.
Chapter Five Features

The System

Custom Menu (patented)

The Custom Menu provides you with a shortcut to monitor, tune or change the parameter values that you use most often. You can go directly to the Custom Menu in the Home Page by pressing \( \text{\textbullet} \). This provides a fast and convenient way to monitor and change settings.

You can create your own Custom Menu with as many as 16 of the active parameters from the list below. When a parameter is placed in the Custom Menu it is accessible through both the Custom Menu and its original menu. If you change a parameter in the Custom Menu it is automatically changed in its original menu. If you change a parameter in its original menu it is automatically changed in the Custom Menu.

If you do not assemble a Custom Menu, four default parameters will automatically appear in the Custom Menu.

To change the list of parameters in the Custom Menu, press both the \( \text{\textbullet} \) and \( \text{\textdagger} \) keys for 6 seconds. This will take you to the Factory Page. The Custom Menu \( \text{\textbullet} \) is the first menu on the Factory page. Press the \( \text{\textbullet} \) key once to go to the first selection in the menu. The parameter choices will appear in the top display and the selection number will appear in the bottom display. Use the \( \text{\textbullet} \) or the \( \text{\textdagger} \) key to change the selected parameter in the top display. If you do not want a parameter to appear for that location, select \( \text{\textbullet} \). To change the other 15 selections, press \( \text{\textbullet} \) to select a place in the menu, \( \text{\textbullet} \) to \( \text{\textdagger} \), in the bottom display and use the \( \text{\textbullet} \) or the \( \text{\textdagger} \) key to change the parameter selected in the top display.

---

**Figure 5.1 – Parameters available for the Custom Menu (*default selections).**

Note: The Custom Menu will not appear if the ramping software option has been ordered (96XX-XXXX-AAXX).
Auto-tune

Auto-tuning allows the controller to explore the responsiveness of the system to determine an effective set of parameters for PID control. To do this it crosses an auto-tune set point several times, then controls at the normal set point using the new parameters.

Use Auto-tune Set Point [AtSP] (User Menu) to select the temporary set point, as a percentage of the normal set point, that the controller will tune to. Initiate or cancel the auto-tune process with Initiate Auto-tune [Aut] (User Menu).

In heat-only or cool-only modes the only option is [Auto].

In heat/cool or cool/heat modes there are three tuning options:

- [Auto] tunes both heat and cool at the same time. This is appropriate if the system typically operates with both heat and cool contributing, such as in an environmental chamber.
- [PID1] tunes just PID set 1. This is appropriate for tuning the heat of an extruder application in the endothermic mode.
- [PID2] tunes just PID set 2. This is appropriate for tuning the cool set of an extruder application in the exothermic mode.

Power Limit

A high side power limit and low side power limit set the maximum output power within two ranges.

A low side power limit limits the output to a percentage of the maximum output power while the process temperature or value is below the power limit set point.

The high side power limit limits the output to a percentage of the maximum output power while the process temperature or value is above the power limit set point.

The power limits work the same way in a cooling applications, but the negative values are converted to absolute (positive) values for determining whether the range is below or above the power limit set point.

The low side power limit can be viewed or changed with High Power Limit Below [PLB] (Global Menu).

The high side power limit can be viewed or changed with High Power Limit Above [PLA] (Global Menu).

The power limit set point can be viewed or changed with Power Limit Set Point [PLSP] (Global Menu).

The actual output power can be viewed with Percent Output [Pcnt] (Monitor Menu).

**CAUTION:** Choose an auto-tune set point value that will protect your product from possible damage from overshoot or undershoot during the auto-tuning oscillations. If the product is sensitive, carefully select the auto-tune set point to prevent product damage.
Input

Calibration Offset

Calibration offset allows a device to compensate for an inaccurate sensor, lead resistance or other factors that affect the input value. A positive offset increases the input value, and a negative offset decreases the input value.

The input 1 offset value can be viewed or changed with Calibration Offset 1 [CAL] (User Menu).

Filter Time Constant

A time filter smooths an input signal by applying a first-order filter time constant to the signal. Either the displayed value or both the displayed and control values can be filtered. Filtering the displayed value makes it easier to monitor. Filtering the signal may improve the performance of PID control in a noisy or very dynamic system.

View or change the Input 1 time filter with Filter Time Constant 1 [Ftr] (Input 1 Menu). A positive value affects only the viewed values. A negative value affects both the viewed and control values.

Sensor Selection

You need to configure a controller to match the input device, which is normally a thermocouple, RTD or process transmitter. When you select an input device, the controller automatically sets the input linearization to match the sensor. It also sets high and low limits, which in turn limit the range-high and range-low values.

Use Sensor Type 1 [SEn] and Input 1 [ln] (Input 1 Menu) to select the appropriate sensor for Input 1.
Range Low and Range High

The controller constrains the set point to a value between range high and range low. Range high cannot be set higher than the sensor high limit or lower than range low. Range low cannot be set lower than the sensor low limit or higher than range high.

Use Set Point 1 \( \frac{SP}{1} \) (Home Page), Range Low 1 \( rL1 \) and Range High 1 \( rh1 \) (Input 1 Menu) to select or view values for the corresponding Input 1 parameters.

Event Input

With an event input an operator can perform certain operations on a system by opening or closing a switch or applying a dc logic signal to the controller. This feature can add convenience, safety or security to a system.

Use Event Input Status \( ESt \) (Monitor Menu) to read the state of the event input parameter.

Use Event Function \( EFn \) (Input 2 Menu) to select how an event will affect the system.

- \( \text{nonE} \): Events will not affect the system.
- \( \text{SP} \): Switch to the event set point.
- \( \text{OFF} \): Turn off control outputs and disable alarms.
- \( \text{COFF} \): Turn off control outputs.
- \( \text{LOC} \): Lock out key board.
- \( \text{R-ON} \): Switch to manual mode.**
- \( \text{tunE} \): Initiate an auto-tune.
- \( \text{AL} \): Clear an alarm.
- \( \text{SLOC} \): Lock out everything except primary set point (auto or manual). If selected and if a profile is not running (non-ramping mode) will lock the user out of all parameters except set point and event outputs.
- \( \text{LIE} \): Wait-for event input*
- \( \text{PAUSE} \): Pause*
- \( \text{FIL1} \): Profile 1*
- \( \text{FIL2} \): Profile 2*
- \( \text{hold} \): Hold*
- \( \text{ABSP} \): abort set point*

*These parameters are added if the ramping software option has been ordered (96 _ _ - _ _ _ - AA _ _ ) .

**These parameters are removed if the ramping software option has been ordered (96 _ _ - _ _ _ - AA _ _ ) .
Retransmitting a Remote Set Point

The retransmit feature allows an output to retransmit an analog signal that can serve as an input variable for another device. The signal may serve as a remote set point for another controller or it could be used as input for a chart recorder to document system performance over time.

With the remote set point feature a set point can be received from another device or controller. This flexibility allows the output from one controller to control the set point of other controllers for chaining or multi-zone applications.

To use a remote set point a Series 96 must be equipped with Input 2 hardware (96_1-__________).

Zone 1

To use the retransmit feature, a Series 96 must come equipped with a Universal Retransmit board installed in output 4 (96________M-________). Select the output scaling with Analog Output Range Low [A Lo] and Analog Output Range High [A hi] (Output 4 Menu). Set an offset for the output range with Analog Output Offset [ACAL] (Output 4 Menu). For example: If you want to retransmit set point 50° to 250°F and set [A Lo] to 50°, [A hi] to 250°.

Select the value that will be represented by Output 4 with Analog Output Selection [Aout] (Output 4 Menu).

Zones 2 and 3

To scale the remote set point input signal, set the set point value for the lowest Input 2 signal with [rL2] (Input 2 Menu) and the value for the highest Input 2 signal with [rH2] (Input 2 Menu). For example, if you want 4-20mA to represent a 50° to 250° set point, set [rL2] to 50 and [rH2] to 250.

As the Input 2 signal varies between 4 and 20mA, the remote set point value will vary between 50° and 250°.

Use the Local-Remote parameter [L-r] (User Menu) to switch between the local [L] and remote [r] set point.

Figure 5.5a Retransmitting a remote set point.

Note: Remote set point input option is not available if the ramping option has been ordered (96XX-XXXX-AAXX).

Control Methods

On/Off Control

On/off control switches the output either full on or full off, depending on the input, set point and hysteresis values. The hysteresis value indicates the amount the process value must deviate from the set point to turn on output. Increasing the value decreases the number of times the output will cycle. Decreasing hysteresis improves controllability. With hysteresis set to 0 the process value would stay closer to the set point, but the output would switch on and off more frequently, causing “chattering.”

Set Proportional Band 1 [Pb1] (PID 1 Menu) to 0 to set the controller to on/off control mode. Set the Output 1 hysteresis with Hysteresis 1 [HYS1] (PID 1 Menu).

Figure 5.5b On/off control for cooling and heating.
Proportional Control

Some processes need to maintain a temperature or process value closer to the set point than an on/off control can provide. Proportional control provides closer control by adjusting the output when the temperature or process value is within a proportional band. When the value is in the band, the controller adjusts the output based on how close the process value is to the set point: the closer to set point the lower the output. This is similar to backing off on the gas pedal of a car as you approach a stop sign. It keeps the temperature or process value from swinging as widely as it would with a simple on/off control. However, when a system settles down, the temperature or process value tends to “droop” short of the set point.

With proportional control the output power level equals (set point minus process value) divided by propband.

The PID 1 proportional band can be viewed or changed with Propband 1 [Pb1] (PID 1 Menu).

Proportional plus Integral (PI) Control

The droop caused by proportional control can be corrected by adding integral (reset) control to the system. When the system has settled down the integral (reset) value is tuned to bring the temperature or process value closer to the set point. Integral (reset) determines the speed of the correction. However, this may increase the overshoot that occurs at start-up or when the set point is changed. Too much integral (reset) action will make the system unstable.

Integral (reset) is cleared when the process value is outside of the proportional band.

Reset is measured in repeats per minute. A low reset value causes a slow integrating action.

Integral is measured in minutes per repeat (the inverse of reset). A low integral value causes a fast integrating action.

View or change the Output 1 integral or reset value with Integral 1 [It1] or Reset 1 [rE1] (PID 1 Menu). Integral appears if Units Type [Unit] (Global Menu) is set to [S1]. Reset appears if [Unit] is set to [US].

Table 5.6 – Converting between integral and reset values.

<table>
<thead>
<tr>
<th>Integral Value</th>

<tr>
<td>4 minutes</td>
<td>0.25 repeats per minute</td>
</tr>
</tbody>
</table>

Figure 5.6b Proportional plus integral control.
Proportional plus Integral plus Derivative (PID) Control

Use derivative (rate) control to minimize the overshoot in a PI-controlled system. Derivative (rate) adjusts the output based on the rate of change in the temperature or process value. Too much derivative (rate) will make the system sluggish.

Rate action is active only when the process value is within twice the proportional value from the set point.

View or change the Output 1 derivative or rate with Derivative 1 or Rate 1 (PID 1 Menu). Derivative appears if Units Type (Global Menu) is set to °F. Rate appears if °C is set to °F.

Dual PID

In an application with one output assigned to heating and another assigned to cooling, each will have a separate set of PID parameters and separate dead bands. The heating parameters take effect when the process temperature is lower than the set point and the cooling parameters take effect when the process temperature is higher than the set point.

PID 1 parameters apply to Output 1; PID 2 parameters apply to Output 2. View or change PID 1 and PID 2 parameters in the PID 1 and PID 2 menus (Operations Page).

Dead Band

In a dual PID application the dead bands above and below the set point can be used to save energy and wear on an application by maintaining a process temperature within an acceptable range. Shifting the effective cooling set point and heating set point keeps the two systems from fighting each other.

Proportional action ceases when the process value is within the dead band. Integral action continues to bring the process temperature to the set point. When the value of the dead band is zero, the heating element becomes active when the temperature drops below the set point, and the cooling element switches on when the temperature exceeds the set point.

The dead band for Output 1 can be viewed or changed with Dead Band 1 (PID 1 Menu). The dead band for Output 2 can be viewed or changed with Dead Band 2 (PID 2 Menu).
**Burst Fire**

Burst firing provides even output power with the lowest level of noise generation (RFI). Burst fire is the preferred method for controlling a resistive load, providing a very short time base for longer heater life.

The controller determines when the ac sine wave will cross the 0-volts point, then switches the load on or off only at this point, minimizing RFI.

The burst fire feature for Output 1 can be turned on or off with Burst Fire 1 (PID 1 Menu). The burst fire feature for Output 1 requires either switched dc (96_C-) or solid-state relay (96_K-).

The burst fire feature for Output 2 can be turned on or off with Burst Fire 2 (PID 2 Menu). The burst fire feature for Output 2 requires either switched dc (96_C-) or solid-state relay (96_K-).

![Figure 5.8a Burst fire.](image)

**Ramp to Set Point**

Ramping protects materials and systems that cannot tolerate rapid temperature changes. The value of the ramp rate is the maximum degrees per minute or hour that the system temperature can change.

Select when ramping is active with Ramping Mode (Global Menu).

- OFF: ramping not active.
- Stt: ramp at startup.
- SttP: ramp at startup or when the set point changes.

Select whether the rate is in degrees per minute or hour with Ramp Scale (Global Menu). Set the ramping rate with Ramp Rate (Global Menu).

![Figure 5.8b Ramping to set point.](image)

**Note:** The Ramping Mode will not appear if the ramping software option has been ordered (96XX-XXX-AAXX).
Alarms

An alarm takes some action, usually notifying an operator, when the process temperature leaves a defined range. A user can configure how and when an alarm is triggered and whether it turns off automatically when the alarm condition is over. The alarm examples below are for Output 2.

**Alarm Set Points**

The alarm high set point defines the temperature that will trigger a high side alarm. The alarm high set point must be higher than the alarm low set point and lower than the high limit of the sensor range.

The alarm low set point defines the temperature that will trigger a low side alarm. The alarm low set point must be lower than the alarm high set point and higher than the low limit of the sensor range.

**Alarm Hysteresis**

Modbus Register #720 r/w; values: (1-9999).

Alarm hysteresis is a zone inside each alarm set point. This zone is defined by adding the hysteresis value to the alarm low set point or subtracting the hysteresis value from the alarm high set point.

An alarm state is triggered when the process value reaches the alarm high or alarm low set point. Alarm hysteresis defines how far the process must return into the normal operating range before the alarm can be cleared.

The alarm hysteresis value for Output 2 can be viewed or changed with Hysteresis 2 [HY52] (Output 2 Menu).

**Process or Deviation Alarms**

A process alarm uses one or two absolute set points to define an alarm condition.

A deviation alarm uses one or two set points that are defined relative to the control set point. High and low alarm set points are calculated by adding and/or subtracting offset values from the control set point. If the set point changes, the window defined by the alarm set points automatically change with it.

Alarm 2 Type [AY32] (Output 2 Menu) allows you to view or change whether the Output 2 alarm will function as a process or deviation alarm.

The alarm deviation value of Output 2 can be viewed or changed with Alarm 2 High [A2h] and Alarm 2 Low [A2l] (Alarm Menu).

**Alarm Latching**

Modbus Register #721 r/w; values: No (0), Yes (1).

A latched alarm will remain active after the alarm condition has passed. It can only be deactivated by the user. An alarm that is not latched will deactivate automatically when the alarm condition has passed.

Alarm 2 Latching [LAE2] (Output 2 Menu) allows you to view or change whether the Output 2 alarm will latch. A latched alarm condition that has been corrected can be reset by pressing the infinity key.

Figure 5.9a Alarm settings.

Figure 5.9b Alarm latching.
Alarm Silencing

Modbus Register #722 r/w; values: No (0), Yes (1).

Alarm silencing has two uses:

1. It is often used to allow a system to warm up after it has been started up. With alarm silencing on, an alarm is not triggered when the process temperature is initially lower than the alarm low set point. The process temperature has to enter the normal operating range beyond the hysteresis zone to activate the alarm function.

2. Alarm silencing also allows the operator to disable the alarm output while the controller is in an alarm state. The process temperature has to enter the normal operating range beyond the hysteresis zone to activate the alarm output function.

If a Series 96 output is functioning as a deviation alarm, the alarm is silenced when the set point is changed, until the process value re-enters the normal operating range. Alarm Silencing 2 \text{[SIL2]} (Output 2 Menu) allows you to view or change whether alarm silencing is on.

Open Loop Detect

Modbus Register #210 r; values: Clear (0), Error (1).

Open loop detect can alert the user of trouble on the input or output side of the control loop. It only works when the controller is operating with PID control.

An open loop error is triggered when 100 percent power is applied at the control output for a period of time equal to the setting of integral (or the inverse of the reset value) without the input registering a 5° (°F or °C) change.

The open loop detect feature can be turned on or off with Open Loop Detect \text{[OPLP]} (Global Menu).

If an open loop error occurs, the controller outputs will shut off and \text{[OPLP]} will flash in the upper display of the controller. Shut down the system, check the input and control output wiring and check the input and output devices.

Errors

System Errors (error number in top display, error message in bottom display)

Modbus Register #209 r; (values in parenthesis below).

Refer to appendix, page A.2, in back of manual for troubleshooting tips about error codes.

<table>
<thead>
<tr>
<th>Error</th>

</tbody>
</table>

Errors continued on next page.
**Input Errors** (error number in top display, percent output in bottom display)

Modbus Register #101 r; (values in parenthesis below).

- **Err1**: (1) Error 1 indicates the input is too low to measure.
- **Err2**: (2) Error 2 indicates the input is under the sensor range.
- **Err3**: (3) Error 3 indicates the input is over the sensor range.
- **Err4**: (4) Error 4 indicates the input is too large to measure.

No error = (0)

**Bumpless Transfer**

When the sensor opens (fails), the controller switches from automatic to manual operation. If bumpless transfer is active when the sensor fails, the control output (or outputs) will remain stable — a bumpless, or smooth, transition.

If the Failure Mode [FAIL] (Global Menu) is set to bumpless [BPLS] and the process has stabilized at a ± 5 percent output power level for 2 minutes prior to the sensor break, and that power level is less than 75 percent, the controller switches to manual operation at the last automatic power level. If these conditions are not met, the output goes to 0 percent power (output disabled).

If Failure Mode is set to manual [MAn], the Series 96 switches to manual operation at the percent power value of Manual Default Power [MAn] (Global Menu). Manual operation provides open-loop control of the outputs from a range of -100 percent to 100 percent output. The Series 96 allows a negative output value only when Output 1 or 2 is set to cool.

When the controller returns to closed-loop control, it uses the previous set point value.

**Communications**

A Series 96 controller can also be programmed and monitored by connecting it with a personal computer or programmable logic controller (PLC) via serial communications. To use this communications option, a Series 96 must be equipped with a EIA/TIA 485 (96_ _ _ _ U - _ _ _ _) or EIA/TIA 232 (96_ _ _ _ R - _ _ _ _) communications board installed for Output 4.

Use of the EIA/TIA 485 requires that your PC or PLC use the EIA/TIA 485 interface in half duplex. Purchase an interface converter which communicates in half duplex when using a PC or PLC with an EIA/TIA 232 communications port. You must use the EIA/TIA 485 option to communicate with more than one control. This option directly supports up to 32 devices on a network.

To view or change controller settings with a personal computer, you need to run software that uses the Modbus RTU protocol to read or write to registers in the controller. See Chapter Six for the Modbus registers. These registers contain the parameter values that determine how the controller will function and the values that reflect the current input and output values of the system.

Decimal points are not sent or received in Modbus. To determine decimal point locations, read the decimal parameter [DEC]. For example, 127.5 degrees is read or written as 1275 degrees with the decimal parameter set to 0.0.

Parameters relating to communications appear in the Output 4 Menu (Setup Page). Match the Baud Rate [baUd] to that of the computer and select an Address [Addr] for the Series 96.

**NOTE:** For more information about communicating with Watlow controllers, go to www.watlow.com and download the Data Communications Reference: Electronic User’s Manual. It is located under Literature, User’s Manuals, English and search on data communications reference.
# Chapter Six
Parameters

## Home Page

The resting-state display shows one of the following sets of data, depending on controller setup. The first prompt appears in the top display, the second in the bottom.

#### Operations Page / Input 2 Menu

| ![InP2](InP2) | **Input 2 Menu** Set the input type parameter of input 2. | ![OFF](OFF) off: (0) | ![OFF](OFF) (0) | 611 r/w | Active if input 2 hardware is present (96 _1 _ _ _ _ _ _ _ _) and Setup Page Lock (Lockout Menu) is not set to ![h d](h d). |

**NOTE:** For more information about how parameter settings affect the controller's operation, see Chapter Five, Features.
**Display**  | **Parameter**  | **Range (Modbus Value)**  | **Default**  | **Modbus Register read/write**  | **Conditions for Parameters to Appear**
---|---|---|---|---|---
| | | | | |  
```
[\text{rL} \text{2}]  
Range Low 2** 
Set the input range low. This setting is the value \( P_{r \text{2}} \) will read when Input 2 is at its low range.
```  
-1999 to 9999  
rL1  
612 r/w  
Active if input 2 hardware is present \((96 _1 _-_ _ _ _ -_ _ _ _),\)  
and Input 2 (Input 2 Menu) is not set to \([\text{E`In}]\) or \([\text{OFF}]\) and Setup Page Lock (Lockout Menu) is not set to \([\text{hide}]\).

```
[\text{rh} \text{2}]  
Range High 2**  
Set the input range high. This setting is the value \( P_{r \text{2}} \) will read when Input 2 is at its high range.
```  
-1999 to 9999  
rh1  
613 r/w  
Active if input 2 hardware is present \((96 _1 _-_ _ _ _ -_ _ _ _),\)  
and Input 2 (Input 2 Menu) is not set to \([\text{E`In}]\) or \([\text{OFF}]\) and Setup Page Lock (Lockout Menu) is not set to \([\text{hide}]\).

```
[\text{CAL} \text{2}] 
Calibration Offset 2**  
Set the input calibration offset. This allows you to compensate for lead resistance, sensor errors and other factors.
```  
-1999 to 9999  
0  
615 r/w  
Active if input 2 hardware is present \((96 _1 _-_ _ _ _ -_ _ _ _),\)  
and Input 2 (Input 2 Menu) is not set to \([\text{E`In}]\) or \([\text{OFF}]\) and Setup Page Lock (Lockout Menu) is not set to \([\text{hide}]\).

```
[\text{E`Fn}]  
Event Function  
Select the event function.
```  
\( \text{nonE} \) no function (0)  
\( \text{SP} \) switch to event set point (1)**  
\( \text{OFF} \) turn off control outputs and disable alarms (2)  
\( \text{OFF} \) turn off control outputs (3)  
\( \text{LOC} \) lock out key board (4)  
\( \text{A-M} \) switch to manual mode (5)**  
\( \text{tunE} \) initiate an auto-tune (6)  
\( \text{AL} \) clear alarm (7)  
\( \text{SLOC} \) lock out everything except primary set point (auto or manual). If selected and if a profile is not running (non-ramping mode) will lock the user out of all parameters except set point and event outputs. (8)  
\( \text{LOE} \) wait-for event input (9)*  
\( \text{PrUS} \) pause (10)*  
\( \text{FiL} \) profile 1 (11) *  
\( \text{FiL2} \) profile 2 (12) *

How to Navigate with the Ramping Menus

<table>
<thead>
<tr>
<th></th>
<th>Pre-run Menu</th>
<th>Program Menu</th>
<th>Run Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter menu</td>
<td>Press the Infinity key.</td>
<td>Press the Advance key.</td>
<td>Press the Infinity key two times or one time if the profile indicator is flashing.</td>
</tr>
<tr>
<td>Scroll thru menu.</td>
<td>Press the Advance key.</td>
<td>Press the Advance key.</td>
<td>Press the Advance key.</td>
</tr>
<tr>
<td>Change prompt values.</td>
<td>Press Up and Down arrow keys.</td>
<td>Press Up and Down arrow keys.</td>
<td>Menu is read only.</td>
</tr>
<tr>
<td>Exit menu.*</td>
<td>Press the Advance key repeatedly.</td>
<td>Press the Infinity key.</td>
<td>Press the Advance key repeatedly.</td>
</tr>
</tbody>
</table>

*Exit menu refers to returning back to the display of process value in the upper display and active set point value in the lower display. The ramping set point will be active while running a profile and the manual adjustable set point will be active when a profile is not running.

NOTE: For more information about how parameter settings affect the controller’s operation, see Chapter Five, Features.
Pre-run and Run Menus

The Pre-run and Run menu prompts are only visible when in the Pre-Run or Run mode.

The Pre-run mode is entered by pressing the \[\text{Infinity}\] key one time while at the Home Page location. The profile indicator light flashes while in the Pre-run mode. The Pre-run menu consists of the [\(F\).\(LE\)], \[STEP\], \[ESU\] and prompts. The Pre-run menu allows the user to select a profile and step number to run or to resume running a profile. The Pre-run menu contains these three prompts and does not revolve around in a continuous loop. Pressing the \[\text{Advance}\] key at the \[ESU\] prompt will not advance you back to the top of the Pre-run menu. If the \[\text{Advance}\] key is pressed at the \[ESU\] prompt, the user will exit out of the Pre-run menu and return to the display of process/current set point. The Run mode is active when a program is running. The Run mode is entered by pressing the \[\text{Infinity}\] key one time while in the Pre-run menu. The profile indicator light will be full on while in the Run mode. The \[F-\(SE\)] file-step prompt is visible in the Run menu and shows the current file and step number of the running profile. Other prompts in the Run menu show the target end set point, as well as status for time remaining, ramp rate, wait-for, and jump count if relevant.

Pre-run Menu

\[F\).\(LE\]  (File number - step number)

Run Menu

\[F-\(SE\] File number - step number
\[\text{EnsP}\] End set point for step
\[\text{Hour}\] Hours remaining in step
\[\text{Min}\] Minutes remaining in step
\[\text{Sec}\] Seconds remaining in step
\[\text{RLE}\] Ramp rate in minutes for step
\[\text{LJE}\] Wait-for event
\[\text{UdE}\] Wait-for process deviation value selection for step
\[\text{EJC}\] Elapsed jump count for last jump step

Running a Series 96 Profile

1. You must be at the Home Page location before you can begin running a profile. Start your profile by entering the pre-run menu. Enter the pre-run menu by pressing the infinity key.
2. The profile indicator LED begins flashing. The upper display shows the file number to be run and the bottom display shows the \[F\).\(LE\] parameter. Use the \[\text{Up}\] and \[\text{Down}\] arrow keys to select which profile number to run.
3. Press the \[\text{Advance}\] key, the upper display shows the step number to be run and the bottom display shows the \[STEP\] parameter. Use the \[\text{Up}\] and \[\text{Down}\] arrow keys to select which step number to start ramping at.
4. Press the \[\text{Infinity}\] key again and the profile will start running. If not pressed within approximately one minute, the controller will automatically exit out of a pre-run mode. If the \[\text{Infinity}\] key is pressed within one minute, the profile indicator LED will change from flashing to being continually lit to indicate the profile is now running. The upper display shows the process value and the lower display will show the ramping set point or soak set point value.
5. You may step through the Run menu parameters with the \[\text{Advance}\] key while the profile is running. The Run menu will show the file/step number, and what the parameters are set to. At any time, you may press the \[\text{Infinity}\] key to stop the profile. To resume running the profile where it was stopped, press the \[\text{Infinity}\] key once; the profile indicator \[\text{LED}\] begins flashing. Now, press the \[\text{Advance}\] key repeatedly until the \[ESU\] parameter appears in the lower display; once again, press the \[\text{Infinity}\] key and the profile resumes running. After the profile has ended, the profile indicator LED will turn off and the lower display will read \[\text{OFF}\] or the last profile step set point depending on the \[End\] prompt setting.

Resume a Profile

To resume a halted profile, from the Home Page, press the \[\text{Infinity}\] key once to enter the Pre-run Menu. Press the \[\text{Advance}\] key twice until the \[ESU\] parameter appears in the lower display. The lower display will show \[ESU\] and the upper display will show the file and step number that will be resumed (file-step). Press the \[\text{Infinity}\] key again, the profile resumes, and the profile indicator LED is lit. You can only resume at the exact step you left off on. If you halt a running profile and make changes to the current step, you cannot resume the profile. The \[ESU\] parameter only appears when a running profile has been halted.

To Run your profile... Press the \[\text{Infinity}\] key twice.
To Stop a running profile... Press the \[\text{Infinity}\] key once.
To Resume a halted profile... Press the \[\text{Infinity}\] key once, press the \[\text{Advance}\] key repeatedly until the \[ESU\] parameter appears in the lower display, and press the \[\text{Infinity}\] key.
Jump-loops

The Series 96 can jump forward or backwards at any step. You cannot jump-loop to the step that you are on.

Example: Step 1 Set Point Step
Step 2 Set Point Step
Step 3 Soak Step
Step 4 Set Point Step
Step 6 End [END]

In this example the program will execute steps 2 through 4 a total of 2 times. This includes the initial pass and the pass associated with the Jump Count of 1 [JC]. Following the second pass the [END] End step (Step 6) will be executed and the program will end.

Your Jump Count can be any number from 0 to 255. If you enter 0, this will be an infinite loop and never progresses to Step 6.

When Jump File is not set to the current program file, the profile may jump to any step of the other file.

The Wait-for Functions of the Soak Step

There are two wait-for functions. The first is Wait-for Event. The profile will wait-for the programmed event input condition to occur. The desired event condition is programmed by the [ECN] parameter. If the [LJE] parameter is set to [OFF], the function will be ignored.

The second wait-for function is Wait-for Process Deviation Value. If a value is entered for this prompt, the profile will wait at this step until the desired process value is equal to or within the Wait-for Process Deviation Value band. Even though only one numeric number is programmed to wait-for, this absolute number represents both a positive and negative window around the desired process value.

Both wait-for functions (if enabled) must be satisfied before the time entered in the Soak step will begin to decrement. Once the wait-for condition has been satisfied, the soak step time will continue to decrement regardless of event input or process changes during the remainder of the profile step.

Event Input Functions

In addition to being able to set the event input as a Wait-for Event, the event input can also be programmed to pause a running profile, start a profile, hold a profile, or abort a profile.

If the event input is set to Pause a profile, satisfying the event input condition will toggle the profile between hold and resume.

If the event input is set to Hold, the profile will end when the event input condition is satisfied. The controller will return to the non-ramping mode and will continue to control the outputs by holding the last active profile step set point and event output settings.

If the event input is set to Abort Set Point, the profile will end when the event input condition is satisfied. The controller will return to the non-ramping mode and continue to operate by using the set point value programmed at the Abort parameter. The event output settings will remain in the same state as the profile step settings when the profile was aborted.

NOTE: For more information about how parameter settings affect the controller's operation, see Chapter Five, Features.

</tr>
</thead>
<tbody>
<tr>
<td>Power</td>
<td>• Power to unit may be off.</td>
<td>• Check switches, fuses, breakers, interlocks, limits, connectors, etc. for energized condition and proper connection.</td>
</tr>
<tr>
<td></td>
<td>• Fuse may be blown.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Breaker may be tripped.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Safety interlock door switch etc. may be activated.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Separate system limit control may be latched.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Wiring may be open.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Input Power may be incorrect.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Address parameter may be incorrectly set.</td>
<td>• Check comms setup menu and set to correct address.</td>
</tr>
<tr>
<td></td>
<td>• Baud rate parameter may be incorrectly set.</td>
<td>• Check comms setup menu and set to correct baud rate.</td>
</tr>
<tr>
<td></td>
<td>• Unit-to-unit daisy chain may be disconnected.</td>
<td>• Look for a break in the daisy chain.</td>
</tr>
<tr>
<td></td>
<td>• Communications wiring may be reversed, shorted or open.</td>
<td>• Verify correct connections and test wiring paths.</td>
</tr>
<tr>
<td></td>
<td>• EIA-485 converter box may be incorrectly wired.</td>
<td>• Check converter box wiring and its documentation.</td>
</tr>
<tr>
<td></td>
<td>• Computer COM port may be incorrectly set up.</td>
<td>• Reconfigure computer's COM port setup and verify communications ok.</td>
</tr>
<tr>
<td></td>
<td>• Communications software setup or address may be incorrect.</td>
<td>• Check the communication card documentation for setable variables and operational testing.</td>
</tr>
<tr>
<td></td>
<td>• Protocol or parity may be wrong, should be 8, n, 1.</td>
<td>• Restart COMS software and check for settings agreement. Verify the COM bus is active.</td>
</tr>
<tr>
<td></td>
<td>• Application software not working properly.</td>
<td>• Verify operation with Watlow comms tool.</td>
</tr>
<tr>
<td></td>
<td>• May need termination and pull-up and pull-down resistors.</td>
<td>• Add termination resistors per EIA-485 standards if using this option.</td>
</tr>
</tbody>
</table>
## Input Error (error number in top display, % LED lit, percent power in bottom)

<table>
<thead>
<tr>
<th>Indication</th>
<th>Probable Cause(s)</th>
<th>Corrective Action</th>
</tr>
</thead>
</table>
| • Input is in error condition.  
  **Err 1** Underflow | • The sensor may be improperly wired.  
• Sensor wiring may be reversed, shorted or open.  
• Input type setting may be for the wrong sensor/may not be calibrated.  
• Ambient temperature may be too hot or too cold.  
• The open loop detect shows a broken sensor.  
• The calibration offset parameter is set much too high or low.  
• Calibration may have been corrupted. | • Check sensor connections.  
• Check sensor connections and sensor wiring.  
• Change the Sensor Type parameter to match the sensor hardware.  
• Change the Sensor Type parameter to match the sensor hardware. Try Restore Factory Calibration (Cal. 1 Menu).  
• Verify that the temperature surrounding the controller is 32 to 149°F (0 to 65°C).  
• Check sensor function. The Open Loop Detect parameter indicates it may be broken.  
• Check the Calibration Offset parameter value; set it to the correct value.  
• Restore factory calibration. See pg. 6.22 for selecting \( \text{rSt} = \text{yes} \). |
| **Err 2** Under Sensor | | |
| **Err 3** Over Sensor | | |
| **Err 4** Overflow | | |

## Alarms

<table>
<thead>
<tr>
<th>Indication</th>
<th>Probable Cause(s)</th>
<th>Corrective Action</th>
</tr>
</thead>
</table>
| • Alarm won't occur. | • Alarm output may be off.  
• Alarm set points may be incorrect.  
• Alarm may be silenced.  
• Alarm sides may be incorrect.  
• Controller may be in diagnostics mode. | • Configure output as an alarm.  
• Check alarm set points.  
• To clear the alarm, correct the alarm condition; check to see if the alarm is latched.  
• Check the alarm sides setting.  
• Check the alarm type setting. |
| • Alarm won't clear. | • Alarm may be latched.  
• Alarm set points may be incorrect.  
• Alarm hysteresis may be incorrect.  
• Input may be in error condition. | • Check the alarm logic for compatibility with system peripherals and annunciators.  
• Check the power limit setting.  
• Check the operation mode.  
• Check the alarm output function.  
• Check the °C or °F setting.  
• Check the calibration offset value; set it to a lower level. |

## Unit Errors (error number in top display, error message in bottom display)

### Special Modbus Functions

The following are modbus registers with special functions. Disable Non-volatile Memory (24); Alarm Status Output 2 (106); Alarm Status Output 3 (110); Auto-Manual Operation Mode (200); Clear Input Errors (311); Clear Alarms (331); Silence Alarms (332).

A “0” indicates an active state. Send “1” to the register to activate the function. It will automatically reset to “0” when the function is complete.

**Note:** For Absolute Modbus numbers, add 40001 to the Relative number.

**Note:** Refer to p. 7.7 for Modbus Register Numbers for ramping parameters.
Declarations of Conformity
Series 96
WATLOW Winona, Inc.
1241 Bundy Boulevard
Winona, Minnesota  55987  USA

Declarations that the following product:  

Designation:  Series 96  
Model Number(s):  96 (A or B) (0 or 1) – (C, D, F or K) (A, C, D, F or K) (A or D) (A, D, M, R or U) – (Any four letters or numbers)  
Classification:  Temperature control, Installation Category II, Pollution degree 2  
Rated Voltage:  100 to 240 V~ (ac) or 24 to 28 V= (ac or dc)  
Rated Frequency:  50 or 60 Hz  
Rated Power Consumption:  7VA maximum  

Meets the essential requirements of the following European Union Directives by using the relevant standards show below to indicate compliance.  

89/336/EEC Electromagnetic Compatibility Directive  
EN 61000-4-4:1995 – Störfestigkeit gegen schnelle Stöße/Burst  
EN 61000-4-5:1995 with A1, 1996 – Störfestigkeit gegen Überspannungen  
EN 61000-4-6:1996 – Conducted Immunity  
EN 61000-3-3: 1995 Grenzen der Spannungsschwankungen und Filmmern  
EN 61000-4-3:1997 – Störfestigkeit gegen Strahlungsfelder  
EN 61000-4-4:1995 – Störfestigkeit gegen schnelle Stöße/Burst  
EN 61000-4-6:1996 – Geleitete Störfestigkeit  
EN 61000-4-11:1994 Störfestigkeit gegen Spannungsabfall, kurze Unterbrechungen und Spannungsschwankungen  
EN 61000-3-3: 1995 Grenzen der Spannungsschwankungen und Filmmern  
EN 61000-4-2:1996 con A1, 1998 – Inmunidad a cambio radiado  
EN 61000-4-3:1997 – Inmunidad a incremento repentino/rápidas fluctuaciones eléctricas transitorias  
EN 61000-4-4:1995 – Inmunidad a incremento repentina/rápidas fluctuaciones eléctricas transitorias  
EN 61000-4-5:1995 con A1, 1996 – Inmunidad a picos de voltaje o corriente  
EN 61000-4-6:1996 – Inmunidad por conducción  
EN 61000-4-11:1994 Inmunidad a caídas de voltaje, variaciones y pequeñas interrupciones de voltaje  

73/23/EEC Low-Voltage Directive  

Declaración de conformidad de la siguiente producto:  

Designación:  Serie 96  
Número de modelo:  96 (A o B) (0 ó 1) - (C, D, F o K) (A, C, D, F o K) (A o D) (A, D, U, M o R) - (Cualesquiera cuatro letras o números)  
Clasificación:  Control de temperatura, Categoría de instalación II, Grado de contaminación 2  
Tensión nominal:  100 a 240 V~ (CA o CD)  
Frecuencia nominal:  50 ó 60 Hz  
Consumo nominal de energía:  7 VA máximo

Répond aux normes essentielles des directives suivantes de l'Union européenne en utilisant les standards normalisés ci-dessous qui expliquent les normes auxquelles répondent :  

Directive 89/336/CEE sur la compatibilité électromagnétique  
EN 61000-4-2:1996 Avec A1, 1996 – Immunité aux décharges électrostatiques  
EN 61000-4-3:1997 – Immunité aux champs de radiation  
EN 61000-4-4:1995 – Immunité contre les surtensions électriques rapides/ Rafale  
EN 61000-4-5:1995 avec A1, 1996 – Immunité contre les surtensions  
EN 61000-4-6:1996 – Immunité conduite  
EN 61000-4-11:1994 Immunité contre les écarts de tension, interruptions courtes et variations de tension  

Directive 73/23/CEE sur les basses tensions

Specifications
(2200)

Controller
- Microprocessor-based, user-selectable control modes
- Heat and cool auto-tune for control outputs
- Universal input 1, auxiliary input 2, 4 outputs
- Control outputs user-selectable as on/off, P, PI, PID
- Input sample period: Single input 10Hz (100 msec), dual input 5Hz (200 msec) adjustable digital filter
- Display update: 2Hz (500 msec), adjustable digital filter
- Retransmit output update: 1 Hz (1 second)
- Output update: burst, 0.1 to 999.9 seconds
- Input/Output/Communication isolation
- Displayed in °C, °F, or process units

Operator Interface
- Dual 4-digit LED displays: upper 0.4 in (10.2mm), lower 0.244 in (6.2mm)
- Advance, Up Arrow, Down Arrow, Infinity tactile keys

Standard Conditions For Specifications
- Ambient temperature 77°F/25°C ±3°C, rated line voltage, 50 to 60Hz, 0 to 90% RH non-condensing, 15-minute warm-up

Universal Input 1
Thermocouple
- Type J, K, T, N, C (W5), E, PT100, D (W3), B, R, S thermocouple types
- >20MΩ input impedance
- Maximum 20Ω source resistance
- 30µA open detection bias

RTD
- 2- or 3-wire platinum, 100Ω
- JIS and DIN curves
- Whole or tenth degree indication
- 150µA nominal RTD excitation current

Process
- Range selectable: 0-10V = (dc), 0-5V = (dc), 1-5V = (dc), 0-20mA, 4-20mA,
- Voltage input impedance 20kΩ
- Current input impedance 100Ω
- Minimum current source resistance 1MΩ
- Input resolution 50,000 bits (approx.) at full scale
- mV input impedance 20MΩ

Input 2
Event Input
- Contact or voltage
- 20KΩ input impedance
- Voltage input: event high state 3 to 36V = (dc), event low state 0 to 2V = (dc)
- Resistance/contact input: event high state > 23kΩ, event low state 0 to 2kΩ

Remote Set Point Input: mA or DC Range Selectable
- Voltage input impedance 20kΩ
- Current input impedance 100Ω

Output Types
Open Collector/Switched DC
- Open collector configuration:
  - Maximum voltage 42V = (dc)
  - Maximum current 200mA
  - Maximum “on” resistance 1.1Ω
  - Maximum offstate leakage current 100µA
- Switched dc configuration:
  - Switched dc supply voltage 22 to 28V = (dc)
  - dc supply current limited to 30mA

Solid-state Relay
- Optically isolated
- Zero cross switched
- Without contact suppression
- Minimum load current 0.5mA rms
- Maximum current 0.5A rms at 20 to 280V ~ (ac)
- Maximum offstate leakage current 10µA rms
- For resistive loads only, must use RC suppression for inductive loads

Electromechanical Relay
- Form C contact configuration
- Minimum load current 10mA @ 5V = (dc)
- Rated resistive and inductive loads: 2A @ 250V ~ (ac) or 30V = (dc) maximum
- Electrical life 100,000 cycles at rated current
- For resistive loads only, must use RC suppression for inductive loads

Process
- Range selectable: 0-20mA, 4-20mA, 0-5V = (dc), 1-5V = (dc), 0-10V = (dc)
- Reverse or direct acting
- 0 to 10V = (dc) voltage output into 1,000 Ω minimum load resistance
- 0 to 20mA current output into 800 Ω maximum load resistance
- Resolution:
  - dc ranges = 2.5mV nominal
  - mA ranges = ±30µA
- Calibration accuracy:
  - dc ranges = ±15mV
  - mA ranges = ±30mA
- Temperature stability 100ppm°C

Retrasmit
- Range selectable: 0-20mA, 4-20mA, 0-5V = (dc), 1-5V = (dc), 0-10V = (dc)
- 0 to 10V = (dc) voltage output into a 1,000 Ω minimum load resistance
- 0 to 20mA current output into an 800 Ω maximum load resistance
- Resolution:
  - dc ranges = 2.5mV nominal
  - mA ranges = ±30µA
- Calibration accuracy:
  - dc ranges = ±15mV
  - mA ranges = ±30mA
- Temperature stability 100ppm°C
Communications
- EIA/TIA-485 or EIA/TIA-232
- Opto-isolated
- Modbus™ RTU protocol
- 1200, 2400, 4800, 9600, 19200 baud rates
- 32 maximum units can be connected (with additional 485 repeater hardware, up to 247 units may be connected)

Accuracy
- Input ranges
  - Type J: 32 to 1382°F or 0 to 750°C
  - Type K: -328 to 2282°F or -200 to 1250°C
  - Type T: -328 to 662°F or -200 to 350°C
  - Type N: 32 to 2282°F or 0 to 1250°C
  - Type E: -328 to 1470°F or 0 to 900°C
  - Type C(W5): -328 to 4200°F or 0 to 2315°C
  - Type D(W3): -328 to 4200°F or 0 to 2315°C
  - Type PTII: -328 to 2540°F or 0 to 1393°C
  - Type R: -328 to 2642°F or 0 to 1450°C
  - Type S: -328 to 2642°F or 0 to 1450°C
  - Type B: 1598 to 3092°F or 870 to 1700°C
  - DIN: -328 to 1382°F or 0 to 750°C
  - JIS: -328 to 1382°F or 0 to 750°C
  - Process: -1999 to 9999 units

• Calibration accuracy ±0.1% of span ±1°C at standard conditions
  - Type T: 0.12% of span for -200°C to -50°C
  - Types R and S: 0.15% of span for 0°C to 100°C
  - Types B: 0.24% of span for 870°C to 1700°C
• Temperature span: 1,000°F/540°C minimum
• Temperature stability: ±0.1 degree per degree change in ambient

RTD Inputs
- Calibration accuracy ±0.1% of span ±1°C at standard conditions
- Accuracy span: 1,000°F/540°C minimum
- Temperature stability: ±0.05 degree per degree change in ambient

Process Inputs
- Voltage input ranges
  - Accuracy ±10mV ±1 LSD at standard conditions
  - Temperature stability ±100ppm/°C maximum
- Milliamp input ranges
  - Accuracy ±20µA ±1 LSD at standard conditions
  - Temperature stability ±100ppm/°C maximum

Agency Approvals
- UL 916 Listed file number E185611; c-UL Approved
- UL CCN QQXY, QQXY7 Process Control Equipment
- CE and NEMA 4X approved.

Modbus™ is a trademark of AEG Schneider Automation.
UL® is a registered trademark of the Underwriter’s Laboratories, Inc.

Terminals
- Touch safe
- 22 to 12 AWG

Power
- 100-240V (ac/dc) +10%; -15%; 50/60Hz, ±5%
- 24-28V (ac/dc) +10%; -15%; 50/60Hz, ±5%
- 7.0VA maximum power consumption
- Data retention upon power failure via nonvolatile memory

Operating Environment
- 32 to 149°F, 0 to 65°C
- 0 to 90% RH, non-condensing
- Storage temperature: -40 to 185°F, -40 to 85°C

Dimensions
- Width 2.05 in. or 52mm
- Height 2.05 in. or 52mm
- Length 4.2 in. or 107mm
- Depth behind panel surface 3.875 in. or 98.4mm
- Approximate controller weight 0.4 lbs (0.2 kg)

Ordering Information

(2201)

Series 96 9 6

Microprocessor-based 1/16 DIN with universal input 1.
Options include software, power supply, input 2, four outputs and display color

**Power Supply**

A = 100-240V\(\approx\) (ac/dc)
B = 24-28V\(\approx\) (ac/dc)

**Input 2**

0 = None
1 = Event input & 0-5V\(\approx\) (dc)/4-20mA (remote set point input)

**Output 1**

C = Switched dc/open collector
D = Electromechanical relay, Form C, 2A, without RC suppression
F = Universal Process, range selectable: 0-20mA, 4-20mA, 0-5V\(\approx\) (dc), 1-5V\(\approx\) (dc), 0-10V\(\approx\) (dc)
K = 0.5A solid-state relay without RC suppression

**Output 2**

A = None
C = Switched dc/open collector
D = Electromechanical relay, Form C, 2A, without RC suppression
F = Universal Process, range selectable: 0-20mA, 4-20mA, 0-5V\(\approx\) (dc), 1-5V\(\approx\) (dc), 0-10V\(\approx\) (dc)
K = 0.5A solid-state relay without RC suppression

**Output 3**

A = None
D = Electromechanical relay, Form C, 2A, without RC suppression

**Output 4**

A = None
D = Electromechanical relay, Form C, 2A, without RC suppression

**R = 232 Communications**

**U = 485 Communications**

**M = Universal Retransmit, range selectable: 0-20mA, 4-20mA, 0-5V\(\approx\) (dc), 1-5V\(\approx\) (dc), 0-10V\(\approx\) (dc)**

**Software/Preset Parameters**

00 = Standard software
AA = Ramping
XX = Custom software
XX = Preset parameters

**Standard Display/Overlay**

**Changing this Affects this**

- Changing will change the default
- Changing will convert the temperature scale
- Other effect

*Note: The table above shows the parameters to set up in the given order.*
How to Reach Us

Contact

Your Authorized Watlow Distributor is:

- Phone: (507) 454-5300.
- Fax: (507) 452-4507.
- For technical support, ask for an Applications Engineer.
- To place an order, ask for Customer Service.
- To discuss a custom option, ask for a Series 96 Product Manager.

Warranty

The Watlow Series 96 is warranted to be free of defects in material and workmanship for 36 months after delivery to the first purchaser for use, providing that the units have not been misapplied. Since Watlow has no control over their use, and sometimes misuse, we cannot guarantee against failure. Watlow's obligations hereunder, at Watlow's option, are limited to replacement, repair or refund of purchase price, and parts which upon examination prove to be defective within the warranty period specified. This warranty does not apply to damage resulting from transportation, alteration, misuse, or abuse.

Returns

- Call or fax Customer Service for a Return Material Authorization (RMA) number before returning a controller.
- Put the RMA number on the shipping label, and also on a written description of the problem.
- A restocking charge of 20% of the net price is charged for all standard units returned to stock.

Quality and Mission Statement:

Watlow Winona will be the world's best supplier of industrial temperature control products, services, and systems by exceeding our customers', employees', and shareholders' expectations.
